Assessment of test results Corona Covid-19 Antigen Rapid Test

This document is not a replacement for a doctor's advice. If you have Corona/Covid-19 related symptoms or have doubts about it, always consult a doctor or health/medical professional. Covid-19 symptoms could be other or different than described in this document. Certain patients have none of these symptoms, and still have the Corona virus.

The patient is not ill, does not have a cold, has no fever, no loss of smell or taste, no dry cough, no sore throat. The patient has also recently had no fever, no sore throat, cough or cold.
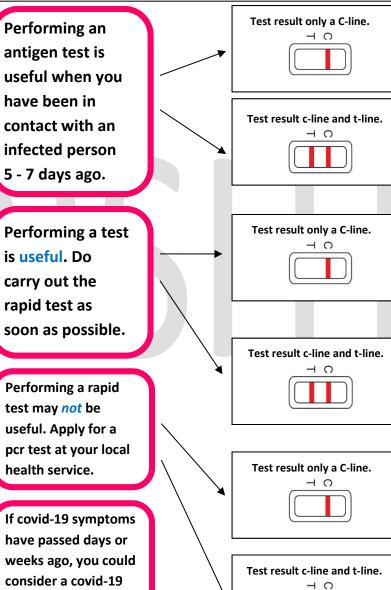

Performing an antigen test is useful when you have been in contact with an infected person 5 - 7 days ago.

Test result only a C-line.

The c-line indicates that the test was done correctly. If no t-line appears, the patient has no corona virus or the concentration is below the test's threshold. The result is negative.

Test result c-line and t-line.

The patient is infected with the Corona virus. Report it to the health authorities and request a pcr test if necessary. The result is positive.

The patient has had a dry cough, sore throat, loss of smell or taste, fever, or a cold for several days.

Performing a test is useful. Do carry out the rapid test as soon as possible.

Test result only a C-line.

The c-line indicates that the test was performed correctly. If no t-line appears, the patient may not be infected with the Corona virus, or the concentration of antigens is too low for the test's threshold. Symptoms can also be caused by a seasonal flu or cold other than the Corona virus. Request a pcr test from your local health authorities.

Test result c-line and t-line.

The patient is infected with the Corona virus. Report it to the health authorities and request a pcr test if necessary. The result is positive.

The patient has had a dry cough, loss of taste or smell, sore throat or fever, chest tightness or a cold for 2 to 3 weeks or longer.

Performing a rapid test may *not* be useful. Apply for a pcr test at your local health service.

The patient has had a mild cold, flu, fever or cough, but has recovered from this days or weeks ago.

If covid-19 symptoms have passed days or weeks ago, you could consider a covid-19 antibody test.

Test result only a C-line.

The c-line indicates that the test was performed correctly. The result is negative. Without a t-line, the patient probably does not have the Corona virus, or the concentration is too low for the test's threshold. Request a pcr test from your local health authorities.

Test result c-line and t-line.

The patient is infected with the Corona virus. Report it to the health authorities and request a pcr test if necessary. The result is positive.
